Acronyms list

API	Application Programming Interface
GUI	Graphical User Interface
HTTP	Hyper Text Transfer Protocol
HTTPS	Hyper Text Transfer Protocol Secure
OS	Operating System
OSS	openSUSE
PHP	PHP: Hypertext Preprocessor
SSL	Secure Sockets Layer
TCP	Transmission Control Protocol
TLS	Transport Layer Security
TUI	Terminal User Interface
UDP	User Datagram Protocol
VPN	Virtual Private Network
WWW	World Wide Web
XAMPP	Cross-Platform, Apache, MySQL, PHP, and Perl

Glossary

Apache2

An opensource HTTP web server.

Browser

A browser is a internet navigation software. It comes in multiple flavours, nowadays the big three are Microsoft Edge, Mozilla Firefox and Google Chrome.

Firewall

A barrier between networks. Controls inbound and outbound traffic.

LibreWolf

An internet browser based on Mozilla's Firefox. It's primary purpose is to allow privacy, and with it comes security. It achieves this by removing telemetry and data collection.

MariaDB

A community-developed fork of MySQL database server.

openSUSE Tumbleweed

An openSUSE (OSS) is an open-source community driven Linux-based distribution sponsored by SUSE Software Solutions. Tumbleweed is a rolling release version allowing for up-to-date software releases.

Operating system

A program that manages a computer's resources from software to hardware.

Python

Python is a high-level programming language, object-oriented.

Perl

A high-level, general-purpose, interpreted, dynamic programming language

Rolling release distribution

A distribution where it's software release cycle is more frequent than those of Long Term Support (LTS). It's up to the Linux-based distributor to guarantee the testing of a package.

Socket

A network socket serves as an endpoint for sending and receiving data across the network.

VPN

A private network creating a secure connection between a device and a network.

Windows

Microsoft's operating system. First released in 1985 as a Graphical User Interface (GUI) for MS-DOS, continued to evolve with it's latest version being 11. Due to it's nature, it's not recommended for server production environment.

Wireshark

Wireshark is a network protocol analyser software. Allows traffic capture between a computer and a network.

XAMPP

A software package environment collection containing Apache2 webserver, MariaDB database, PHP and Perl.

Chapter 1

Introduction

The project consists in building a computer network through four phases. First with a webserver, then simulating a local area network (LAN) with two computers and a switch. By the end of the journey, this project will develop into something similar to a corporate network.

Chapter 2

Phase 1

2.1 Milestones

- Setup apache2 web server in localhost
- Access web server locally (http://127.0.0.1/ or http://localhost)
- Access web server from a remote computer (http://172.24.1.12)
- Use wireshark in a remote host to capture packages from the server
- Compare the HTTP headers sent by the client and the server
- Develop a simple barebones HTTP webclient
- Establish a TCP connection to the server
- Request the base webpage

2.2 WebClient requirements

- HTTP library forbidden
- Establish TCP connection using available sockets library - send/receive the HTTP request/reply
- Output HTTP reply to the user
- - Optional - act to the various HTTP replies
- Text-only application

2.3 Software

- Local server side
 - Operating system: Windows 11 x64
 - WebServer: XAMPP x64 8.2.12-0-VS16 for windows

- Client side

Operating system: openSUSE Tumbleweed

Browser: LibreWolf version 123.0-1

Package monitor: Wireshark version 4.2.3 (Git commit b0da86c196d1).

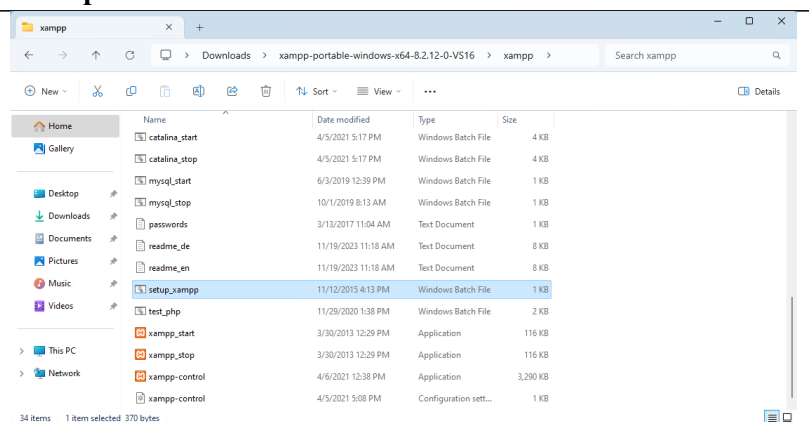

2.4 Software install

First we install, start and configure XAMPP. Using the following link, <https://www.apachefriends.org/download.html>, we can choose our preferred method, for this project the portable version was the best choice since no installation was needed. After uncompressing our downloaded file, we can start the process.

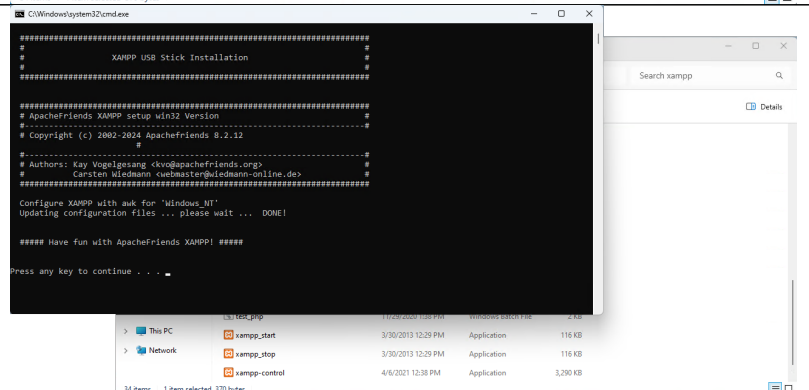

Steps

The read me file available in the root directory states that we need to run `setup_xampp` batch file first to populate the registry it's directory.

Example

After completing, just press any button to continue.

Next click in the `xampp_start` executable, windows will prompt some firewall permissions which will gladly accept.

Continued on next page

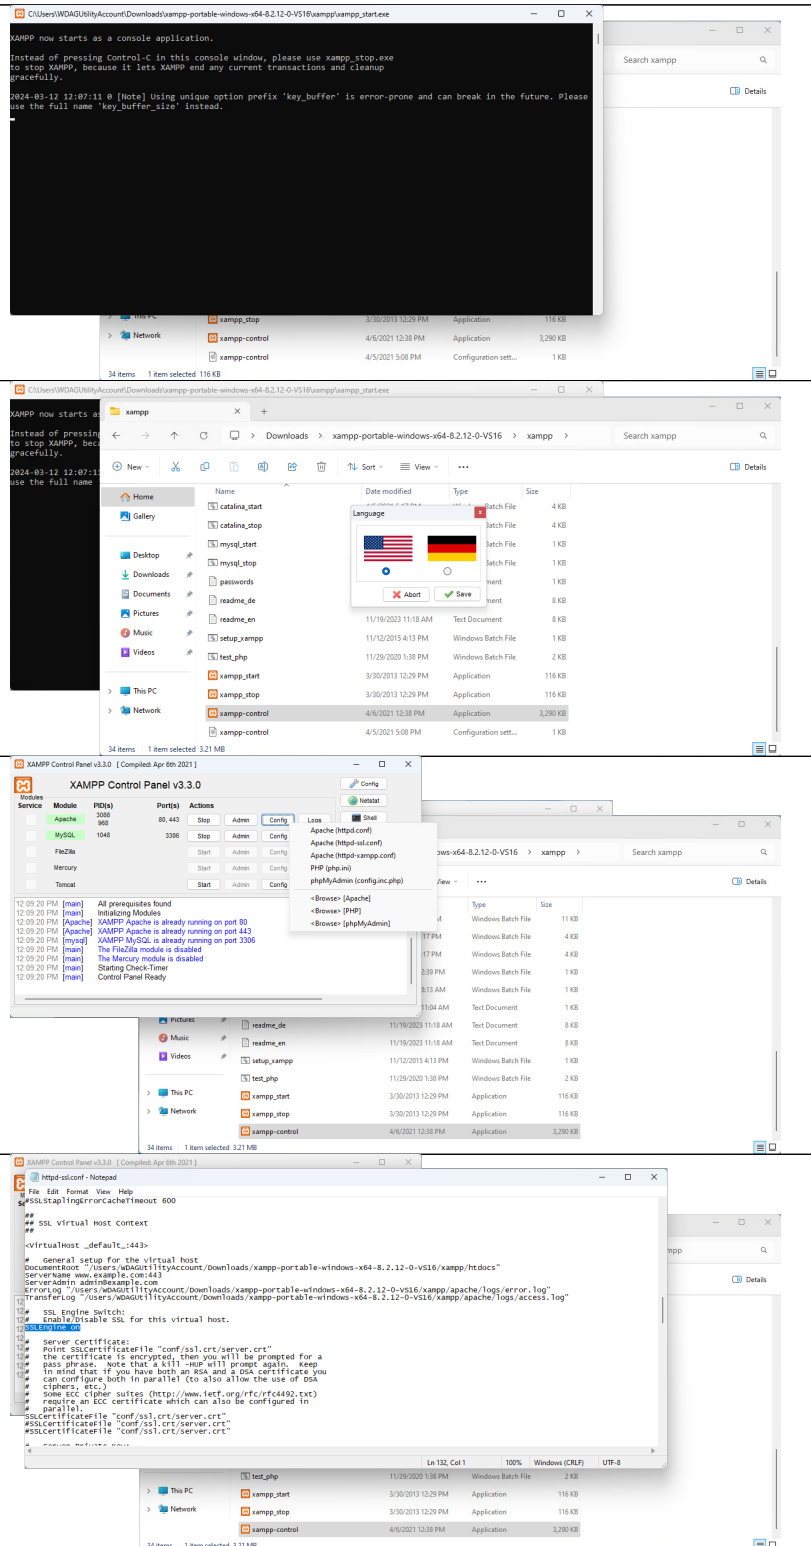

Table 2.1 – continued Steps

Example

Pick a language for the program.

Apache2 comes with SSL on by default. Since we're studying the HTTP protocol it's convenient to disable HTTPS. Pressing the *config* button shows a list of configuration files. Select *Apache (httpd-ssl.conf)*.

Search and comment the line with *SSLEngine on*.

Continued on next page

Table 2.1 – continued
Steps

Previously if we went to *http://localhost* it would redirect to the HTTPS version. After completing the above step it'll no longer redirect, showing us the non-secure version.

Example

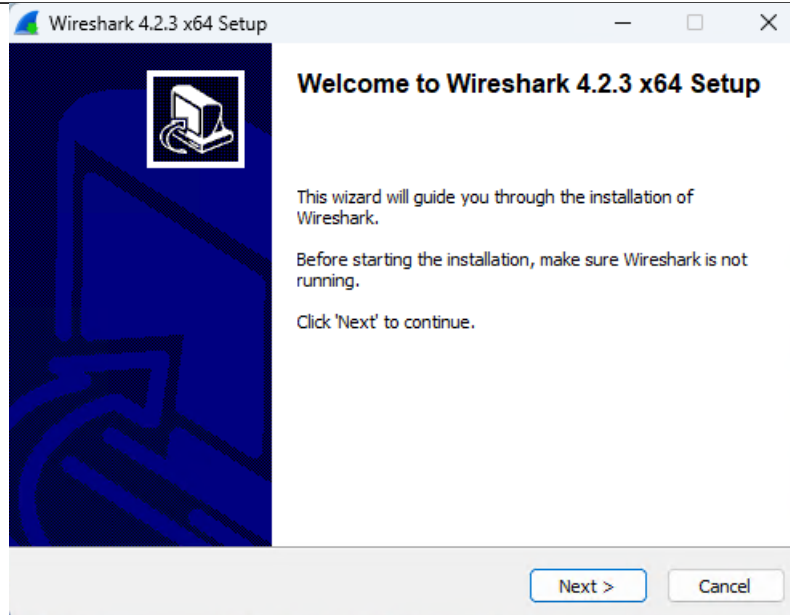

Table 2.1: XAMPP install

Next up is wireshark, the powerful network analyser. We'll download the installer from <https://www.wireshark.org/download.html>.

Steps

Wireshark setup. Select everything available and continue by clicking *next*.

Example

Continued on next page

Table 2.2 – continued
Steps

Example

After completing the installation, reboot the computer.

Table 2.2: Wireshark install

2.5 WebClient - Python Code

```

1  """
2  Name: Python TCP Client
3  Description: Simple TCP client using sockets
4  Original code by: Luis Pires
5  Source: Chapter 2, slide 104
6
7  Commented and adapted by: Nuno Brito
8  """
9
10 # Import from everything from the socket library
11 from socket import *
12
13 # Specify servername and port destination
14 serverName = "172.24.1.12"
15 serverPort = 80
16
17 # GET list
18 httpTestMessages = [
19     "GET /dashboard/ HTTP/1.1\r\n",           # 200 OK
20     "GET /dashboard HTTP/1.1\r\n",           # 301 Moved Permanently
21     "PUT / HTTP/1.1\r\n",                     # 302 Found
22     "GET /dashboard HTTP/1.\r\n",             # 400 Bad Request
23     "GET /dashboard/index.htm HTTP/1.1\r\n", # 404 Not Found
24     "PUT /d HTTP/1.1\r\n",                   # 405 Method Not Allowed
25     "BREW /coffee/ HTTP/1.1\r\n",           # 501 Not implemented
26 ]
27
28 # Cycle through predefined messages

```

```

29 for sentence in httpTestMessages:
30
31     # Socket open and connect
32     clientSocket = socket(AF_INET, SOCK_STREAM)
33     clientSocket.connect((serverName, serverPort))
34
35     # Join serverName to the current sentence
36     sentence += "Host:" + serverName + "\r\n\r\n"
37
38     # Socket encode message and send
39     clientSocket.send(sentence.encode())
40
41     # Receive and out the response message
42     modifiedSentence = clientSocket.recv(1024)
43
44     # Close socket connection
45     clientSocket.close()
46
47     # Print the requested message
48     print ("_"*60)
49     print ("From Server:", modifiedSentence.decode())

```

Listing 2.1: Simple HTTP WebClient using sockets in python

The code listed in 2.1 was adapted to be simple and cycle through the various request messages without any user input.

Modifiable variables include *serverName*, *serverPort* and the *httpTestMessages* list.

The webclient produces the following output:

```

Listing 2.2: WebClient output

2.6 Wireshark captures

First we must ensure the browser being used can connect to the XAMPP server with HTTP. We can do that by enabling the usage of deprecated TLS.

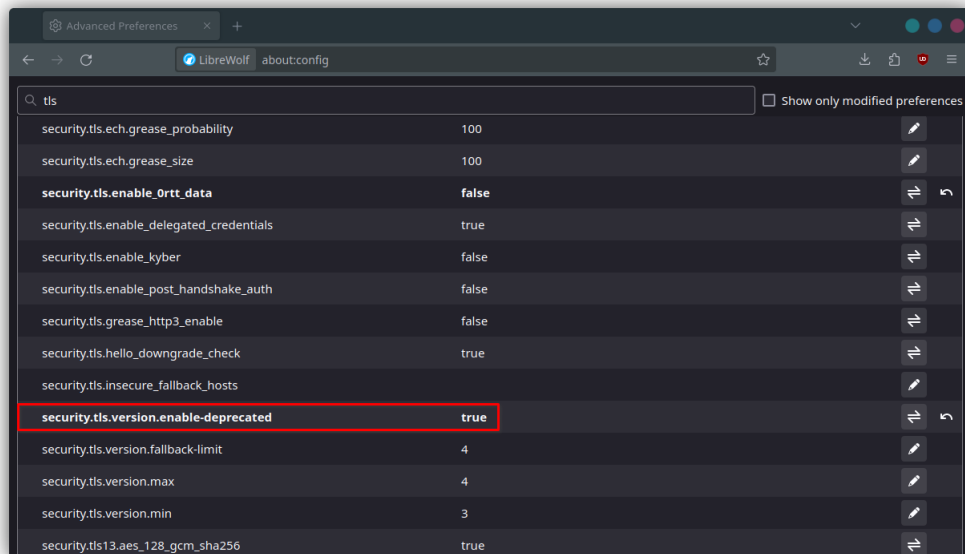

Figure 2.1: Changing from false to true the *security.tls.version.enable-deprecated* option

Then we can start our capture process, next follows some printscreen examples filtered by HTTP.

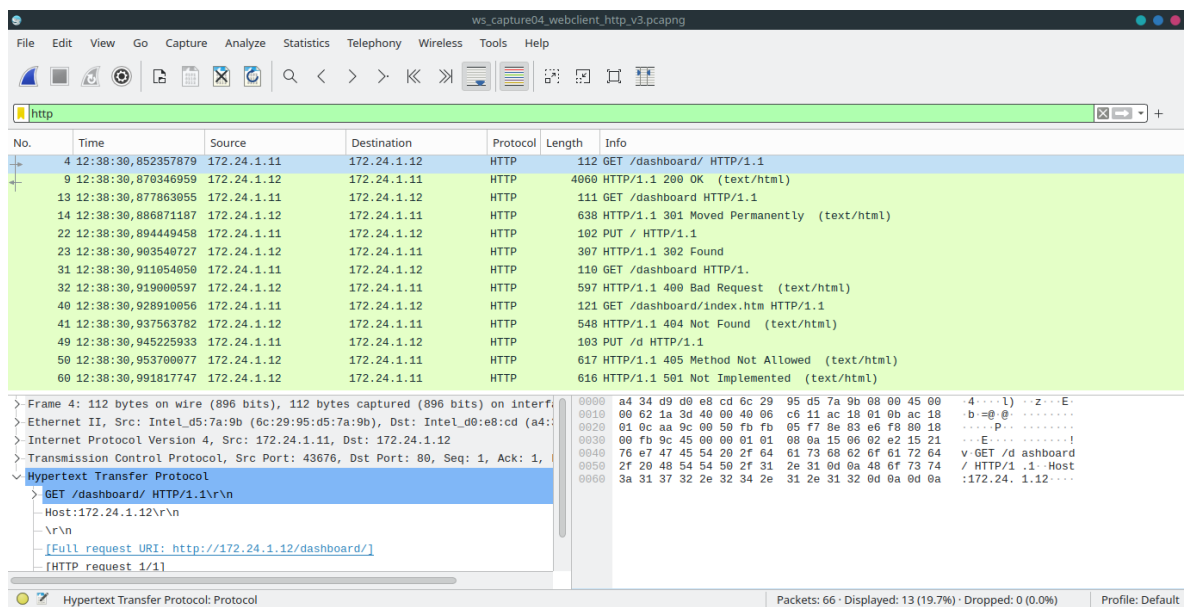

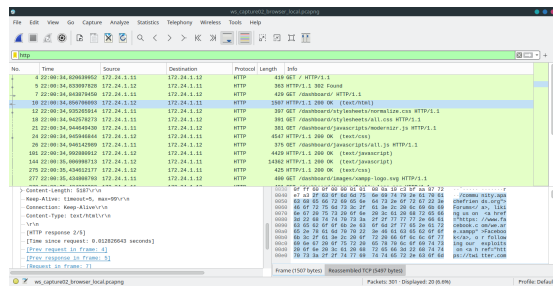

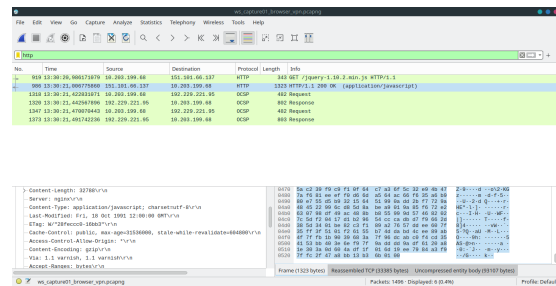

Figure 2.2: Webclient get capture

(a) Browser

(b) Browser (VPN)

Figure 2.3: Browser capture

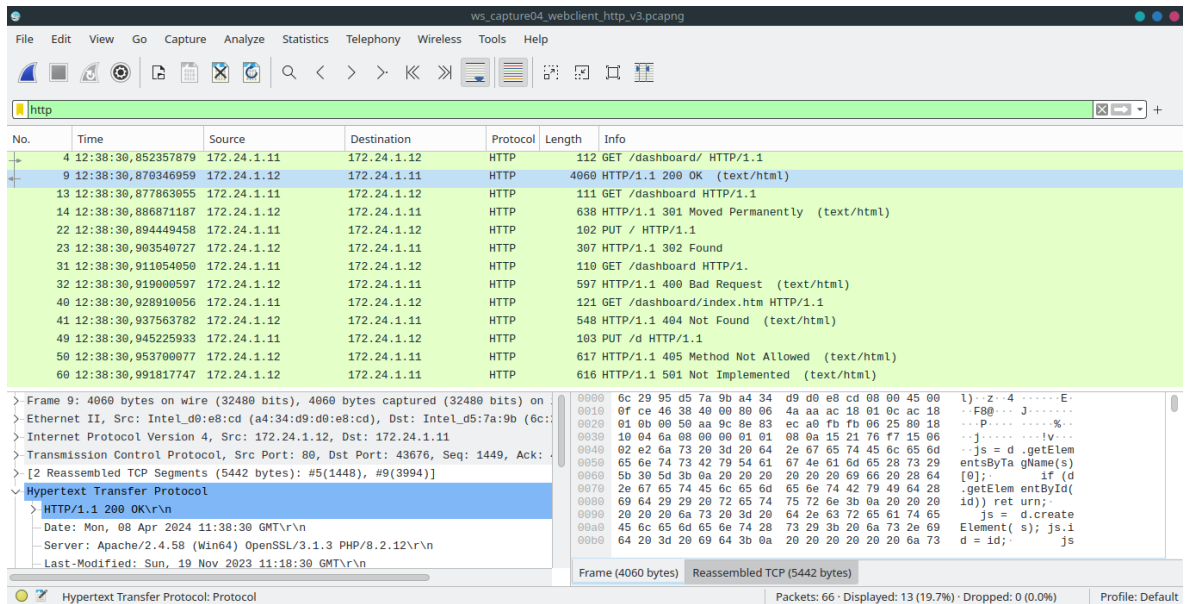

Figure 2.4: Webclient reply capture

To compliment the images, below are segmented outputs (the important parts):

Listing 2.5: Wireshark capture output sample - WebClient

2.7 List of headers and replies

Request: GET /dashboard/ HTTP/1.1\r\nHost:127.24.1.12 \r\n\r\n

Reply: HTTP/1.1 200 OK

Meaning: this header complies with what the server expects from a webclient request.

Request: GET /dashboard HTTP/1.1\r\nHost:127.24.1.12 \r\n\r\n

Reply: HTTP/1.1 301 Moved Permanently

Meaning: this header request a relative directory without a forward slash at the end, prompting the server to reply with a "moved" answer.

Request: PUT / HTTP/1.1\r\nHost:127.24.1.12 \r\n\r\n

Reply: HTTP/1.1 302 Found

Meaning: this header request is an upload request to an unexistent directory.

Request: GET /dashboard HTTP/1.1\r\nHost:127.24.1.12 \r\n\r\n

Reply: HTTP/1.1 400 Bad Request

Meaning: this header request, although it has an invalid directory, has the HTTP protocol version badly written (HTTP/1.1 vs. actual HTTP/1.) which causes a "bad request" reply from the server.

Request: GET /dashboard/index.htm HTTP/1.1\r\nHost:127.24.1.12 \r\n\r\n

Reply: HTTP/1.1 404 Not Found

Meaning: this header request tries to get a file that doesn't exist in the local server.

Request: PUT /d HTTP/1.1\r\nHost:127.24.1.12 \r\n\r\n

Reply: HTTP/1.1 405 Method Not Allowed

Meaning: this header request tries to upload something to the relative directory "d".

Request: BREW /coffee/ HTTP/1.1\r\nHost:127.24.1.12 \r\n\r\n

Reply: HTTP/1.1 501 Not Implemented

Meaning: a poorly attempt to get the 1998 April fool's day. It should have replied with 418 I'm a teapot. Even with GET instead of BREW it didn't work. Apache doesn't have the implementation.

Chapter 3

Phase 2

3.1 Connecting two devices with a switch

This first part is very simple. There are two devices (PC0 and Laptop0) connected to a switch and their network start with 192.168.*GROUP NUMBER*.0. Therefore:

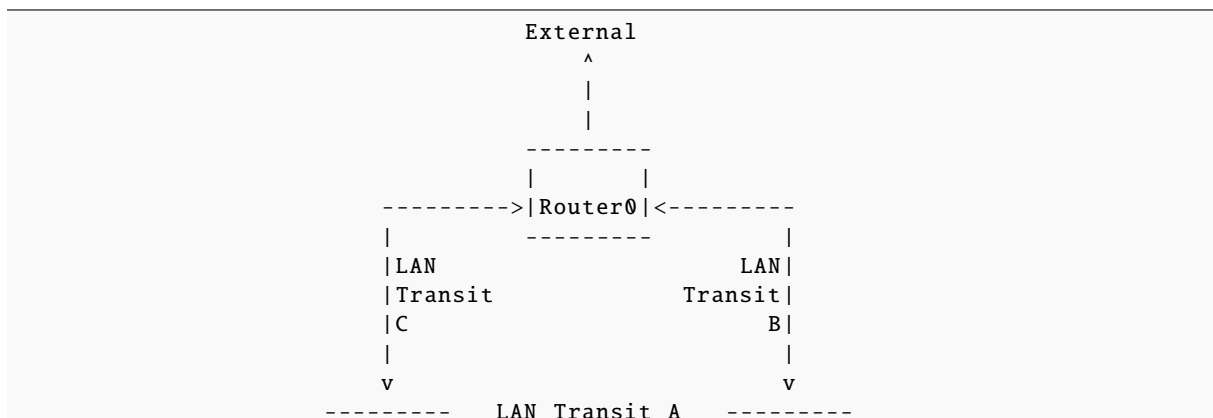

- Group: 7 [192.168.7.0/24]
- Laptop0 [192.168.7.1]
- PC0 [192.168.7.2]

After applying the configuration we must run a set of commands to test our network.

- ping
- tracet
- ipconfig

Question: How can a PC know if it is connected to a switch? Is traceroute useful in this situation?
Answer:

3.2 Connecting two LANs with a router

Listing 3.1: Network plan

Table 3.1: Visual LAN allocation

Name	Network	Usable IPs	Router	Broadcast	Subnet Mask	Populated
	192.168.7.					
LAN Server	128	129 - 253	254	255	128	126
LAN A	64	65 - 125	126	127	192	48
LAN B	32	33 - 61	62	63	224	27
Unused remaining	16	17 - 31		32		0
	12	13 - 14		15		0
LAN Transit C	8	9 - 10		11	252	2
LAN Transit B	4	5 - 6		7	252	2
LAN Transit A	0	1 - 2		3	252	2

Table 3.2: LAN allocation table

The above table will be used for the next phases. Instead of planning for each phase and re-assigning the entire network, the network was fully detailed to accommodate all phases.

However, here we'll focus on router R1 and LAN A. For now let's just focus on the IP addresses, the values will be explained in Phase 3.

Name	Ports Link	Network	IP	Subnet Mask	Gateway
PC0	Fa0 - Sw0 Fa0/2	LAN A	192.168.7.65	255.255.255.192	192.168.7.126
Laptop0	Fa0 - Sw0 Fa0/3		192.168.7.66	255.255.255.192	192.168.7.126
PC1	Fa0 - Sw1 Fa0/2	LAN B	192.168.7.33	255.255.255.224	192.168.7.62
Laptop1	Fa0 - Sw1 Fa0/3		192.168.7.34	255.255.255.224	192.168.7.62
R0	Fa5/0 - R1 Fa5/0	LAN Transit B	192.168.7.5	255.255.255.252	
	Fa4/0 - R2 Fa4/0	LAN Transit C	192.168.7.9	255.255.255.252	
	Fa0/0	External			
R1	Fa4/0 - R2 Fa5/0	LAN Transit A	192.168.7.1	255.255.255.252	
	Fa5/0 - R1 Fa4/0	LAN Transit B	192.168.7.6	255.255.255.252	
	Fa0/0 - Sw0 Fa0/1	LAN A	192.168.7.126	255.255.255.192	
	Fa1/0 - Sw1 Fa0/1	LAN B	192.168.7.62	255.255.255.224	
R2	Fa5/0 - R1 Fa4/0	LAN Transit A	192.168.7.2	255.255.255.252	
	Fa4/0 - R0 Fa4/0	LAN Transit C	192.168.7.10	255.255.255.252	
	Fa0/0 - Sw2 Fa0/4	LAN Server	192.168.7.254	255.255.255.128	
DHCP Server	Fa0 - Sw2 Fa0/3	LAN Server	192.168.7.129	255.255.255.128	192.168.7.254
DNS Server	Fa0 - Sw2 Fa0/2		192.168.7.130	255.255.255.128	192.168.7.254
HTTP Server	Fa0 - Sw2 Fa0/1		192.168.7.131	255.255.255.128	192.168.7.254
Sw0	Fa0/1 - R1 Fa0/0	LAN A			
	Fa0/2 - PC0				
	Fa0/3 - Laptop0				
Sw1	Fa0/1 - R1 Fa1/0	LAN B			
	Fa0/2 - PC1				
	Fa0/3 - Laptop1				
Sw2	Fa0/1 - HTTP	LAN Server			
	Fa0/2 - DNS				
	Fa0/3 - DHCP				
	Fa0/4 - R2 Fa0/0				

Table 3.3: IP configuration table

Name	Ports Link	Network	IP	Subnet Mask	Gateway
PC0	Fa0 - Sw0 Fa0/2	LAN A	192.168.7.65	255.255.255.192	192.168.7.126
Laptop0	Fa0 - Sw0 Fa0/3		192.168.7.66	255.255.255.192	192.168.7.126
PC1	Fa0 - Sw1 Fa0/2	LAN B	192.168.7.33	255.255.255.224	192.168.7.62
Laptop1	Fa0 - Sw1 Fa0/3		192.168.7.34	255.255.255.224	192.168.7.62
R0	Fa5/0 - R1 Fa5/0	LAN Transit B	192.168.7.5	255.255.255.252	
	Fa4/0 - R2 Fa4/0	LAN Transit C	192.168.7.9	255.255.255.252	
	Fa0/0	External			

Table 3.4 continued from previous page

Name	Ports Link	Network	IP	Subnet Mask	Gateway
R1	Fa4/0 - R2 Fa5/0	LAN Transit A	192.168.7.1	255.255.255.252	
	Fa5/0 - R1 Fa4/0	LAN Transit B	192.168.7.6	255.255.255.252	
	Fa0/0 - Sw0 Fa0/1	LAN A	192.168.7.126	255.255.255.192	
	Fa1/0 - Sw1 Fa0/1	LAN B	192.168.7.62	255.255.255.224	
R2	Fa5/0 - R1 Fa4/0	LAN Transit A	192.168.7.2	255.255.255.252	
	Fa4/0 - R0 Fa4/0	LAN Transit C	192.168.7.10	255.255.255.252	
	Fa0/0 - Sw2 Fa0/4	LAN Server	192.168.7.254	255.255.255.128	
DHCP Server	Fa0 - Sw2 Fa0/3	LAN Server	192.168.7.129	255.255.255.128	192.168.7.254
DNS Server	Fa0 - Sw2 Fa0/2		192.168.7.130	255.255.255.128	192.168.7.254
HTTP Server	Fa0 - Sw2 Fa0/1		192.168.7.131	255.255.255.128	192.168.7.254
Sw0	Fa0/1 - R1 Fa0/0	LAN A			
	Fa0/2 - PC0				
	Fa0/3 - Laptop0				
Sw1	Fa0/1 - R1 Fa1/0	LAN B			
	Fa0/2 - PC1				
	Fa0/3 - Laptop1				
Sw2	Fa0/1 - HTTP	LAN Server			
	Fa0/2 - DNS				
	Fa0/3 - DHCP				
	Fa0/4 - R2 Fa0/0				

Table 3.4: IP configuration table

Chapter 4

Issues and fixes

Running python code:

Python3 wasn't installed by default. Then had to run the code with: `$ python3 httpsocketv3.py`.

Encrypted html body in wireshark:

Initially I had to run wireshark in a remote virtual private network (VPN) connection. Fortunately I could see the VPN doing it's magic but also couldn't see the HTTP body, since it was encrypted.

Default HTTP protocol, HTTPS:

To guarantee the HTTP connection I had to disable SSL Engine in Apache2 WebServer.

Chapter 5

Conclusions

During phase 1 many challenges were met. By creating (or in this case adapting) a webclient without using the http library, it allowed a better understanding of the protocol requests and replies by taking advantage of the provided protocol stack in a operating system. Employing the wireless packet monitor, wireshark, concepts related to http were better understood as all transactions between webclient and webserver were seen in real time, allowing a greater furthering of knowledge.
